

Taman Negara National Park, a 2,671 sq miles eco-tourist's haven, is a 130 million-year-old sanctuary to countless birds, butterflies, insects, fish, plants and animals. This relatively untainted park has ancient trees with mammoth buttresses, unique flora and fauna and spectacular caves, waterfalls and mountain peaks.

Many trails through jungle canopy walkways lead to observation hides, allowing visitors to catch a glimpse of wildlife. There are hides close to the Park Headquarters for observing wildlife, but the hides further in offer a better chance for visitors to chance a sighting. This observation is usually best done at night. Other activities here include fishing, bathing in crystal clear pools or shooting down the raging rapids.
